

SMT Alignment

T. Trippe

September 16, 1999

10% Test - Example Initial Configuration - Barrel 4

	Layer	Ladder
	8	4
	5	4
	3	2
	2	2
	2	5
	3	5
	5	10
	8	10

No misalignment

Misalignments obtained
by track fitting

Misalignment obtained
by dropping bad plane

Alignment Strategies - tracking and geometry selections

Upper four ladders: align all four relatively

- Select geometry elements for tracking
BarLayLad = 4202,4302,4504,4804
allowed missing clusters = 0
- Select geometry elements and degrees of freedom for alignment
BarLayLad = 4202,4302,4504,4804
vary = xz

Upper four ladders: track in three, align the fourth

- Select geometry elements for tracking
BarLayLad = 4202,4302,4804
allowed missing clusters = 0
- Select geometry elements and degrees of freedom for alignment
BarLayLad = 4504
vary = xz

Alignment with Constraints

Actual track

Towers aligned
separately

Tracks vertex
constrained

Towers constrained
to single track

Alignment Strategies - tracking constraints

All eight ladders: align all eight with vertex constraint

- Select geometry elements for tracking
BarLayLad = 4202,4302,4504,4804
BarLayLad = 4205,4305,4510,4810
require one track in each, constrain to common vertex
allowed missing clusters = 0
- Select geometry elements and degrees of freedom for alignment
BarLayLad = 4202,4302,4504,4804, 4205,4305,4510,4810
vary = xz

All eight ladders: align to single track

- Select geometry elements for tracking
BarLayLad = 4202,4302,4504,4804, 4205,4305,4510,4810
allowed missing clusters = 0
- Select geometry elements and degrees of freedom for alignment
BarLayLad = 4202,4302,4504,4804, 4205,4305,4510,4810
vary = xz

Alignment issues from earlier discussion with Ela and Silke

- MC generation
- Trigger selection and rate
- Alignment Strategy
- Alignment Program Design
 - program requirements and design
 - use cases
 - logical flow, data flow diagrams
 - class diagrams
- Interface with geometry system
- Event reading and framework
- Residual calculation
- Alignment parameter calculation
- Displays
